Abstract

This talk will consider several techniques that can be used during the development of today's Web sites. We present a database-driven technique that draws a dividing line between the content, style, and logic of a Web site. The talk will explain why it is effective and efficient to implement Web sites in a database-driven fashion. We will conclude with preliminary research results concerning the efficiency of a real-world Web application and discuss future research opportunities in Web-related areas.

Campus Center 206
Friday, September 8, 2006
12:15 – 1:15

All are welcome to attend!
